Estimate mutual information rates and ensure $\hat{I}(X_i; X_j) \approx I(X_i; X_j)$

Estimating the Mutual Information Rates I

• Given $\{X_1[n]\}_{n=0}^{N-1},\ldots,\{X_p[n]\}_{n=0}^{N-1}$, estimate $\{I(X_i;X_j)\}_{(i,j)\in\mathcal{V}}$ using Bartlett's procedure

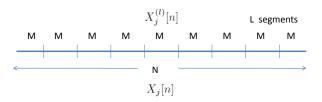

Estimating the Mutual Information Rates I

- Given $\{X_1[n]\}_{n=0}^{N-1},\ldots,\{X_p[n]\}_{n=0}^{N-1}$, estimate $\{I(X_i;X_j)\}_{(i,j)\in\mathcal{V}}$ using Bartlett's procedure
- Divide each length-N realization $\{X_j[n]\}_{n=0}^{N-1}$ into L non-overlapping segments of length M such that $LM \approx N$

Estimating the Mutual Information Rates I

- Given $\{X_1[n]\}_{n=0}^{N-1},\ldots,\{X_p[n]\}_{n=0}^{N-1}$, estimate $\{I(X_i;X_j)\}_{(i,j)\in\mathcal{V}}$ using Bartlett's procedure
- Divide each length-N realization $\{X_j[n]\}_{n=0}^{N-1}$ into L non-overlapping segments of length M such that $LM \approx N$

• Compute the length-M discrete Fourier transform for each signal segment, i.e., $\tilde{X}_i^{(l)}[k] = \mathcal{F}(X_i^{(l)}[n])$

Estimating the Mutual Information Rates II

 Estimate the time-averaged periodograms using Bartlett's averaging procedure on the L signal segments, i.e.,

$$\hat{\Phi}_{X_i}[k] := rac{1}{L} \sum_{l=0}^{L-1} \left| \tilde{X}_i^{(l)}[k] \right|^2$$

$$\hat{\Phi}_{X_i,X_j}[k] := rac{1}{L} \sum_{l=0}^{L-1} \left(\tilde{X}_i^{(l)}[k] \right)^* \tilde{X}_j^{(l)}[k]$$

Estimating the Mutual Information Rates II

 Estimate the time-averaged periodograms using Bartlett's averaging procedure on the L signal segments, i.e.,

$$\hat{\Phi}_{X_i}[k] := rac{1}{L} \sum_{l=0}^{L-1} \left| \tilde{X}_i^{(l)}[k] \right|^2$$

$$\hat{\Phi}_{X_i,X_j}[k] := rac{1}{L} \sum_{l=0}^{L-1} \left(\tilde{X}_i^{(l)}[k] \right)^* \tilde{X}_j^{(l)}[k]$$

• Estimate the magnitude-squared coherences:

$$|\hat{\gamma}_{i,j}[k]|^2 := \frac{|\hat{\Phi}_{X_i,X_j}[k]|^2}{\hat{\Phi}_{X_i}[k]\hat{\Phi}_{X_j}[k]}.$$

Estimating the Mutual Information Rates II

 Estimate the time-averaged periodograms using Bartlett's averaging procedure on the L signal segments, i.e.,

$$\hat{\Phi}_{X_i}[k] := rac{1}{L} \sum_{l=0}^{L-1} \left| \tilde{X}_i^{(l)}[k] \right|^2$$

$$\hat{\Phi}_{X_i,X_j}[k] := rac{1}{L} \sum_{l=0}^{L-1} \left(\tilde{X}_i^{(l)}[k] \right)^* \tilde{X}_j^{(l)}[k]$$

• Estimate the magnitude-squared coherences:

$$|\hat{\gamma}_{i,j}[k]|^2 := \frac{|\hat{\Phi}_{X_i,X_j}[k]|^2}{\hat{\Phi}_{X_i}[k]\hat{\Phi}_{X_i}[k]}.$$

Estimate the MI rates by using the Riemann sum:

$$\hat{I}(X_i; X_j) := -\frac{1}{2M} \sum_{k=0}^{M-1} \log \left(1 - |\hat{\gamma}_{i,j}[k]|^2 \right).$$

• With the estimated $\{\hat{I}(X_i; X_j)\}_{(i,j) \in \mathcal{V}}$, we run a max-weight spanning tree procedure to learn $\hat{\mathcal{T}}$

- With the estimated $\{\hat{I}(X_i; X_j)\}_{(i,j) \in \mathcal{V}}$, we run a max-weight spanning tree procedure to learn $\hat{\mathcal{T}}$
- This procedure is efficient

$$O(p^2(N\log M + \log p)).$$

- With the estimated $\{\hat{I}(X_i; X_j)\}_{(i,j) \in \mathcal{V}}$, we run a max-weight spanning tree procedure to learn $\hat{\mathcal{T}}$
- This procedure is efficient

$$O(p^2(N\log M + \log p)).$$

But not clear how to tradeoff between number of signal segments
 L and length of each segment M

- With the estimated $\{\hat{I}(X_i; X_j)\}_{(i,j) \in \mathcal{V}}$, we run a max-weight spanning tree procedure to learn $\hat{\mathcal{T}}$
- This procedure is efficient

$$O(p^2(N\log M + \log p)).$$

- But not clear how to tradeoff between number of signal segments
 L and length of each segment M
- For convenience, we let $M = M_L$ be a function of L

Concentration of MI Rate

Lemma (Concentration of MI Rate)

If the number of DFT points M_L satisfies

$$\lim_{L\to\infty} M_L = \infty, \qquad \lim_{L\to\infty} L^{-1} \log M_L = 0,$$

Concentration of MI Rate

Lemma (Concentration of MI Rate)

If the number of DFT points M_L satisfies

$$\lim_{L\to\infty} M_L = \infty, \qquad \lim_{L\to\infty} L^{-1} \log M_L = 0,$$

then for any $\eta > 0$, we have

$$\mathbb{P}\left(|\hat{I} - I| > \eta\right) \leq \exp\left[-(L - 1) \min_{\omega \in [0, 2\pi)} \varphi(\gamma(\omega); \eta)\right]$$

Concentration of MI Rate

Lemma (Concentration of MI Rate)

If the number of DFT points M_L satisfies

$$\lim_{L\to\infty} M_L = \infty, \qquad \lim_{L\to\infty} L^{-1} \log M_L = 0,$$

then for any $\eta > 0$, we have

$$\mathbb{P}\left(|\hat{I} - I| > \eta\right) \leq \exp\left[-(L - 1) \min_{\omega \in [0, 2\pi)} \varphi(\gamma(\omega); \eta)\right]$$

We can choose $M=\lceil L^{\varepsilon} \rceil, \varepsilon>0$ to satisfy above condition

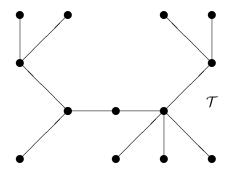

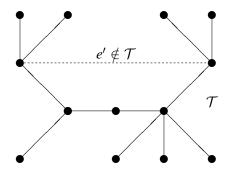

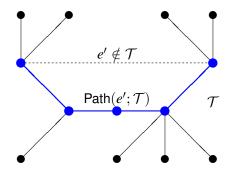

Recall that the optimization for the tree structure is

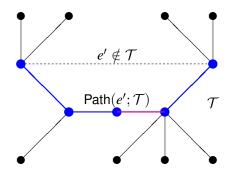

$$\mathcal{T}^* = \underset{\mathcal{T} \in \mathsf{Tree}}{\arg\max} \ \sum_{(i,j) \in \mathcal{T}} \hat{I}(X_i; X_j),$$

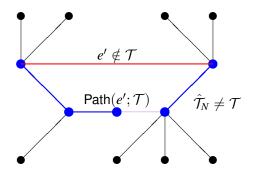

where $\hat{I}(X_i; X_j)$ are the estimated mutual information rates

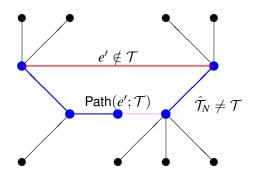

Lemma

$$\left\{\hat{\mathcal{T}}_{N} \neq \mathcal{T}\right\} = \bigcup_{(k,l) \notin \mathcal{E}} \bigcup_{(i,j) \in \textit{Path}(k,l)} \left\{\hat{I}(X_{k}; X_{l}) \geq \hat{I}(X_{i}; X_{j})\right\}$$

Possible to bound $\mathbb{P}(\hat{\mathcal{T}}_N \neq \mathcal{T})$ by using the union bound

Main Result

Theorem

If $\mathcal T$ is a tree and mutual information rates on the edges are uniformly bounded away from zero, and if

Main Result
